1 Idea

We want to look at the relationship between certain prices and the respective search interest on Google for these prices. Can we find granger causality for this relationship? What are possible issues? For example: modern trading algorithms scrape data from the internet and then buy or sell based on the sentiment. Large spikes in search interest may trigger such algorithms. As media spreads the news of price increases more people will look up prices of goods and commodities, again triggering the algorithms. This is basically a feedback loop.

2 Data

First some notes on the data. The data on the search index of certain prices is taken from Google trends which collects the search queries of people within a specific region (here: United States of America). This data is aggregated on a monthly basis and normalized with a range from zero to 100. Already filtered out are duplicate searches in the sense that the same user made the same search multiple times within a short time-frame. This way we exclude the users which have already invested and constantly checked the prices to look how their investment is doing. Data points are divided by total searches for the month and region to represent the relative popularity, i.e. no over-weighting of regions with more people than others which would, given the same search behavior, lead to differing popularities otherwise.

The data on gold prices comes form the London Bullion Market Association Gold Price and the Federal Reserve Bank of St. Louis. It is measured in USD per troy, daily at 3:00pm. Aggregation is done via prices at the end of each month and it is not seasonally adjusted.

In parts of this project we scale the price and search index to a range from zero to one in order to compare the relative movements more easily.

3 Project Code

```
# clear workspace

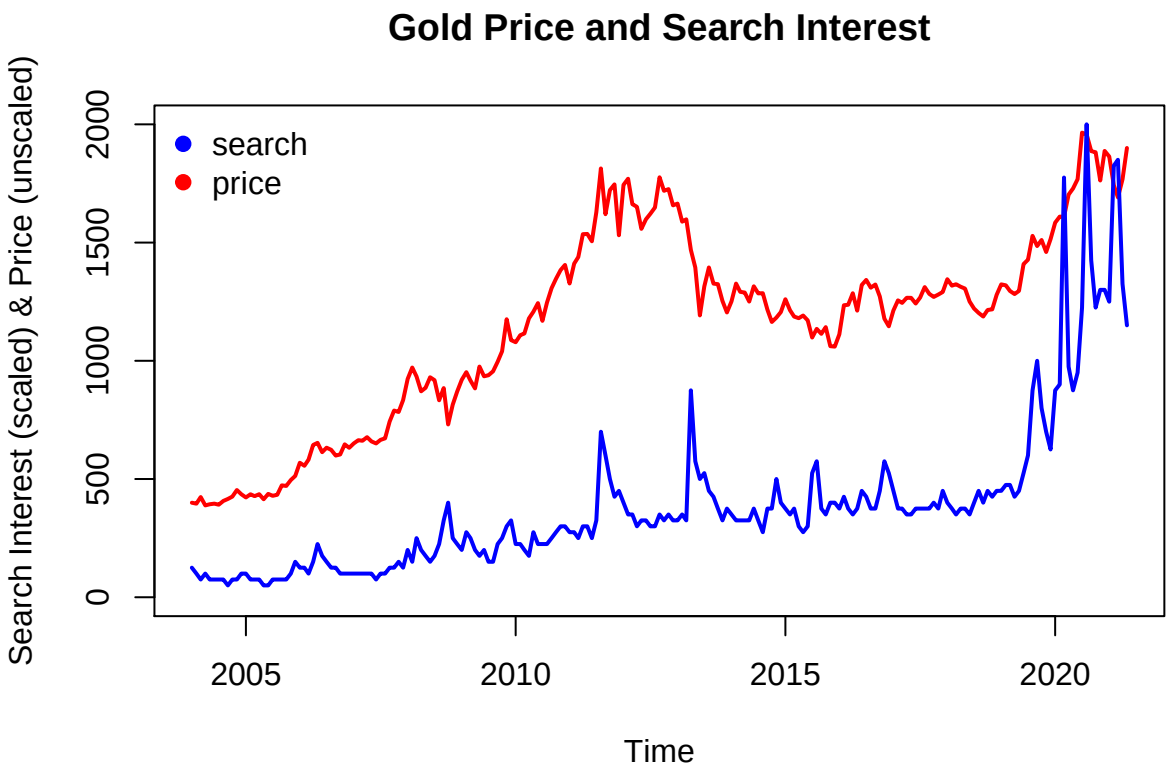
gold_price_HF <- na.locf(gold_price_HF)
gold_date <- gold_pr$DATE
gold_search <- data$GOLD

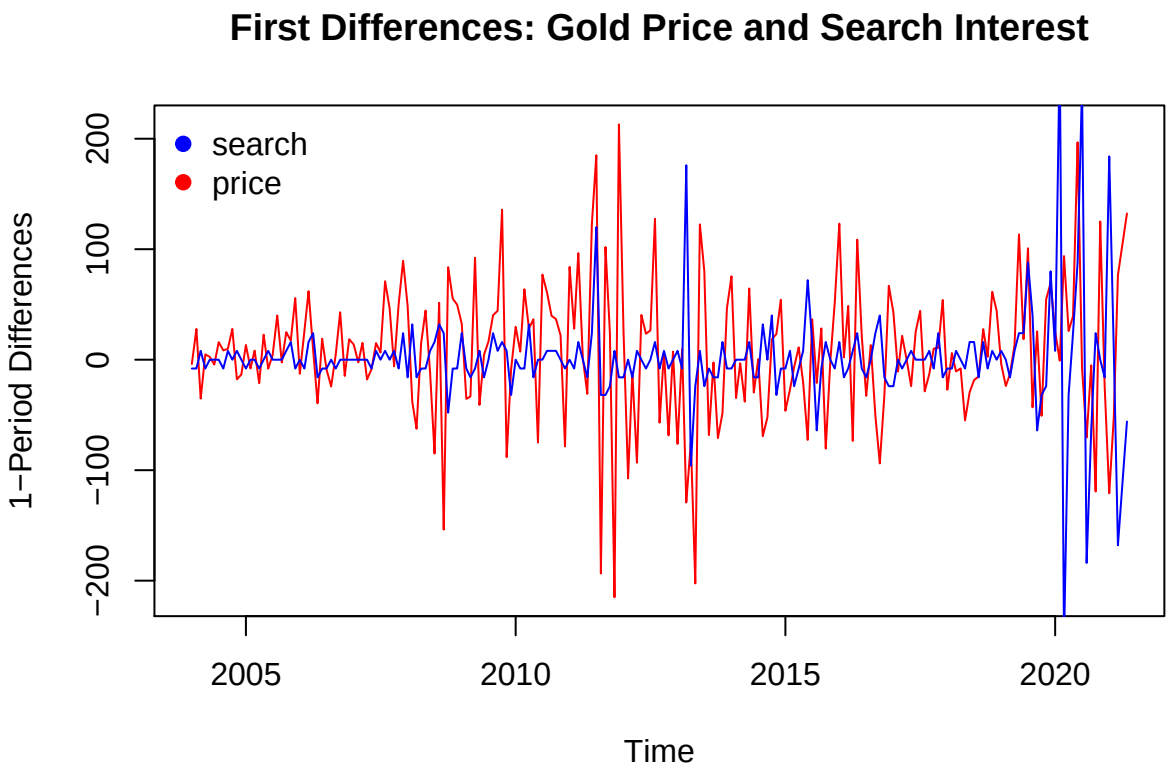
# save as time series:
gold_price <- ts(gold_price,frequency = 12,start = c(2004, 1), end = c(2021, 5))
gold_price_HF <- ts(gold_price_HF, frequency = 365, start = c(2001,1,2), end = c(2021,6,22))
```

```
# plot gold price on monthly basis
plot(y=gold_price,x=gold_date,type = 'l', lwd = 2, col = 'red',
     ylim = c(0,2000), main = 'Gold Price and Search Interest',
     xlab = 'Time', ylab = 'Search Interest (scaled) & Price (unscaled)')
# add gold search interest scaled up
lines(y=25*gold_search,x=gold_date, lwd = 2, col = 'blue')
legend('topleft', legend = c('search','price'),
       col = c('blue','red'), bty = "n", pch = c(19,19))
```



```
# create first differenced prices and search interest
t <- length(gold_date)
gold_price_FD <- rep(0,t-1)
for(i in 2:209){gold_price_FD[i-1] <- gold_price[i]-gold_price[i-1]}
gold_search_FD <- rep(0,t-1)
for(i in 2:209){gold_search_FD[i-1] <- gold_search[i]-gold_search [i-1]}
t_1 <- length(gold_HF$DATE)
gold_daily_FD <- rep(0,t_1-1)
for(i in 2:5332){gold_daily_FD[i-1] <- gold_price_HF[i]-gold_price_HF[i-1]}

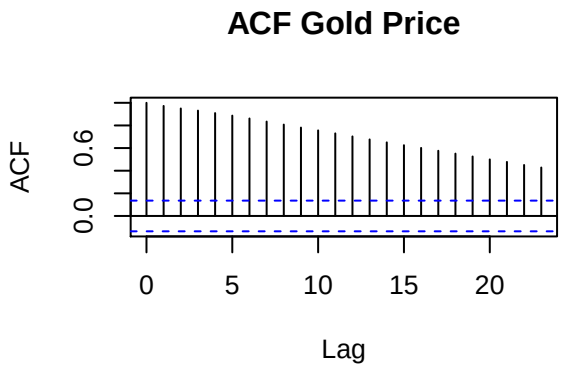
# plot first differenced variables
plot(y=gold_price_FD,x=gold_pr$DATE[1-209], type = 'l', lwd = 1, col = 'red',
     xlab = 'Time', ylab = '1-Period Differences',
     main = 'First Differences: Gold Price and Search Interest')
lines(y=gold_search_FD*8,x=gold_pr$DATE[1-209], lwd = 1, col = 'blue')
legend('topleft', legend = c('search','price'),
       col = c('blue','red'), bty = "n", pch = c(19,19))
```

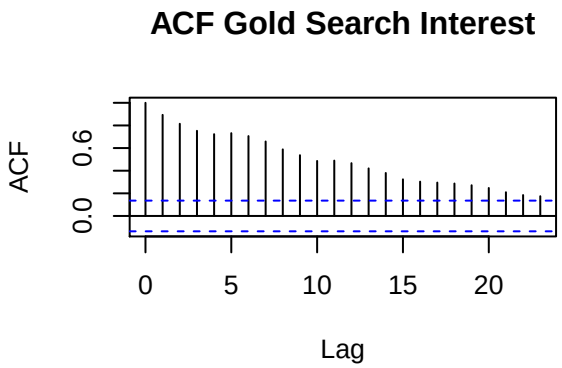


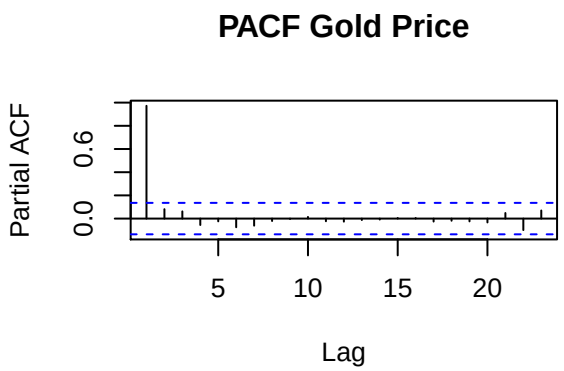
Visually, it appears that the more volatile periods match. An issue seems to be the scaling of the variables.

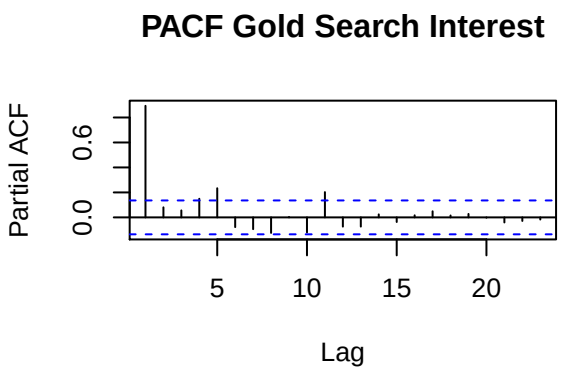
```
# plot ACF for unmodified variables:
par(mfrow=c(2,2))      # changes the plot layout to more easily compare them
acf(gold_pr$GOLDPMGBD228NLBM, main = 'ACF Gold Price')
acf(data$GOLD, main = 'ACF Gold Search Interest')

# plot PACF for unmodified variables:
pacf(gold_pr$GOLDPMGBD228NLBM, main = 'PACF Gold Price')
pacf(data$GOLD, main = 'PACF Gold Search Interest')
```



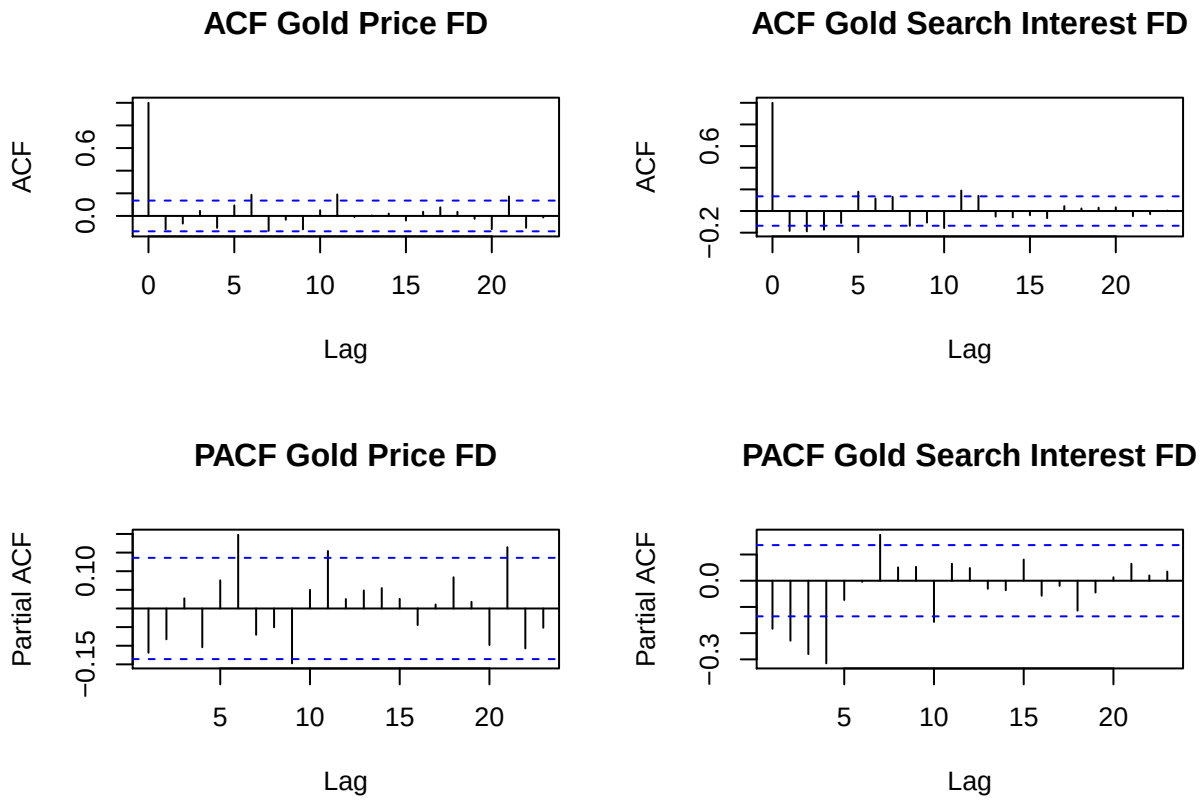






```
# plot ACF for differenced variables
acf(gold_price_FD,main = 'ACF Gold Price FD')
acf(gold_search_FD, main = 'ACF Gold Search Interest FD')

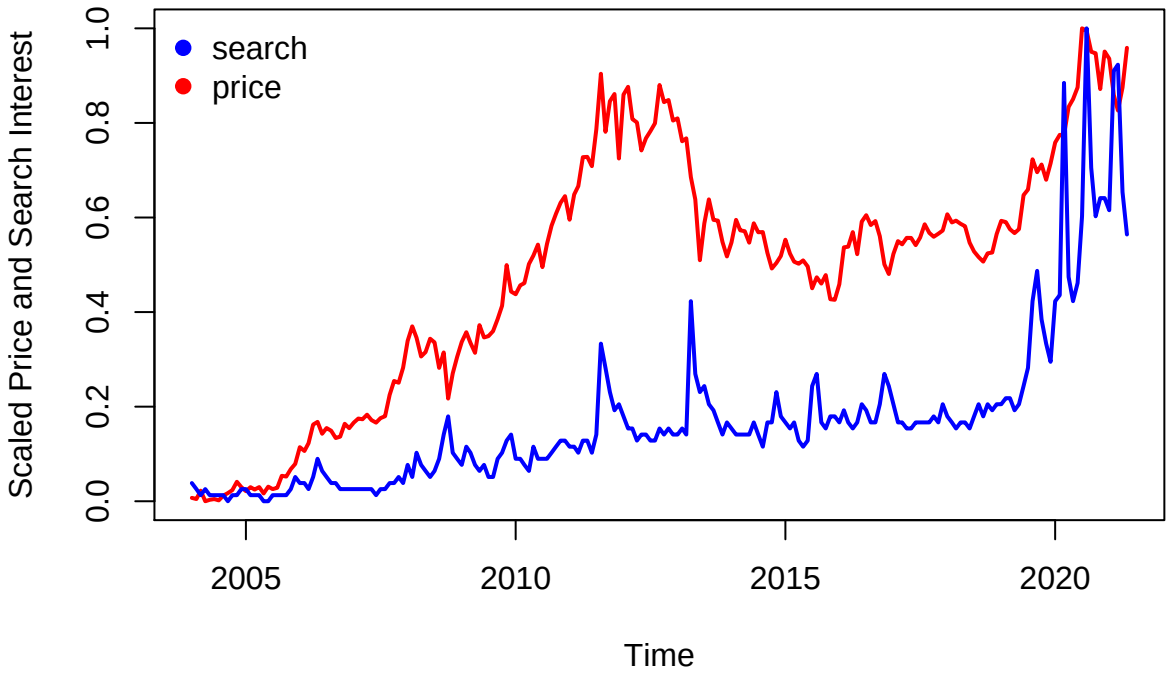
# plot PACF for differenced variables
pacf(gold_price_FD,main = 'PACF Gold Price FD')
pacf(gold_search_FD, main = 'PACF Gold Search Interest FD')
```



```
par(mfrow = c(1,1))    # revert layout changes
```

It might help with the interpretation: scale all variables $\mathbf{X}$ such that $X_t \in [0,1] \forall t \in T$.

```
range01 <- function(x){(x-min(x))/(max(x)-min(x))}
plot(y=range01(gold_pr$GOLDPMGBD228NLBM),x=gold_pr$DATE, lwd = 2, type = 'l',
     ylab = 'Scaled Price and Search Interest',
     xlab = 'Time', col = 'red')
lines(y=range01(data$GOLD),x=gold_pr$DATE, lwd = 2, col = 'blue')
legend('topleft', legend = c('search','price'),
       col = c('blue','red'), bty = "n", pch = c(19,19))
```

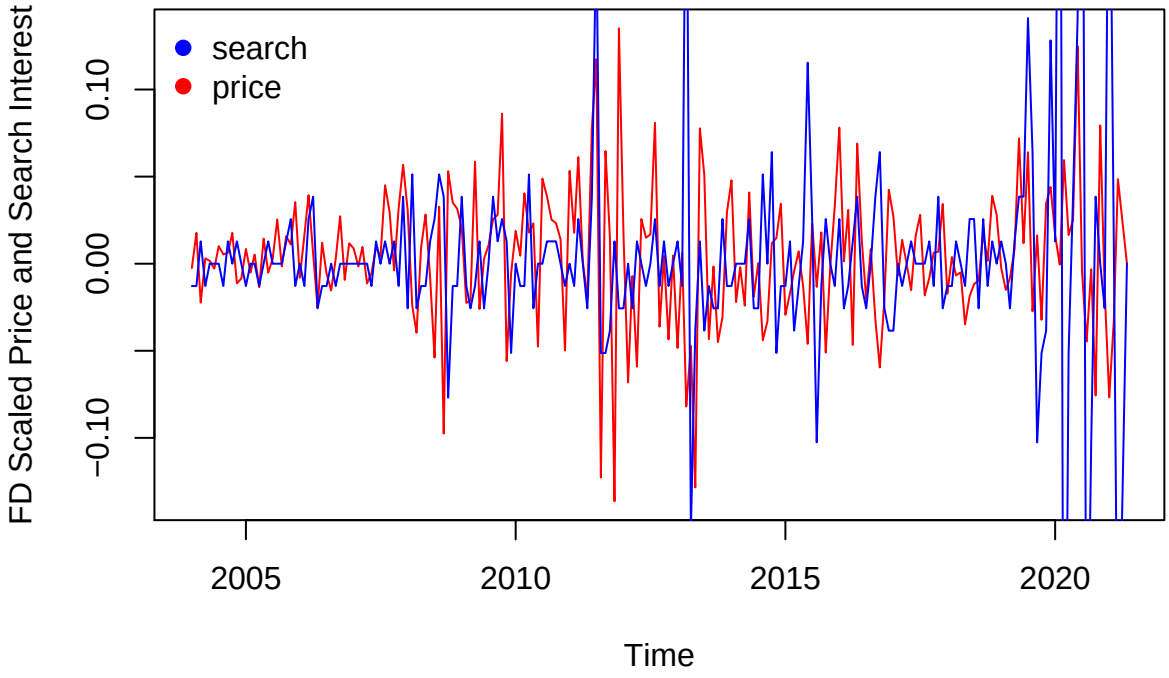


```r
# save scaled variables
gold_price_scaled <- range01(gold_pr$GOLDPMGBD228NLBM)
gold_search_scaled <- range01(data$GOLD)

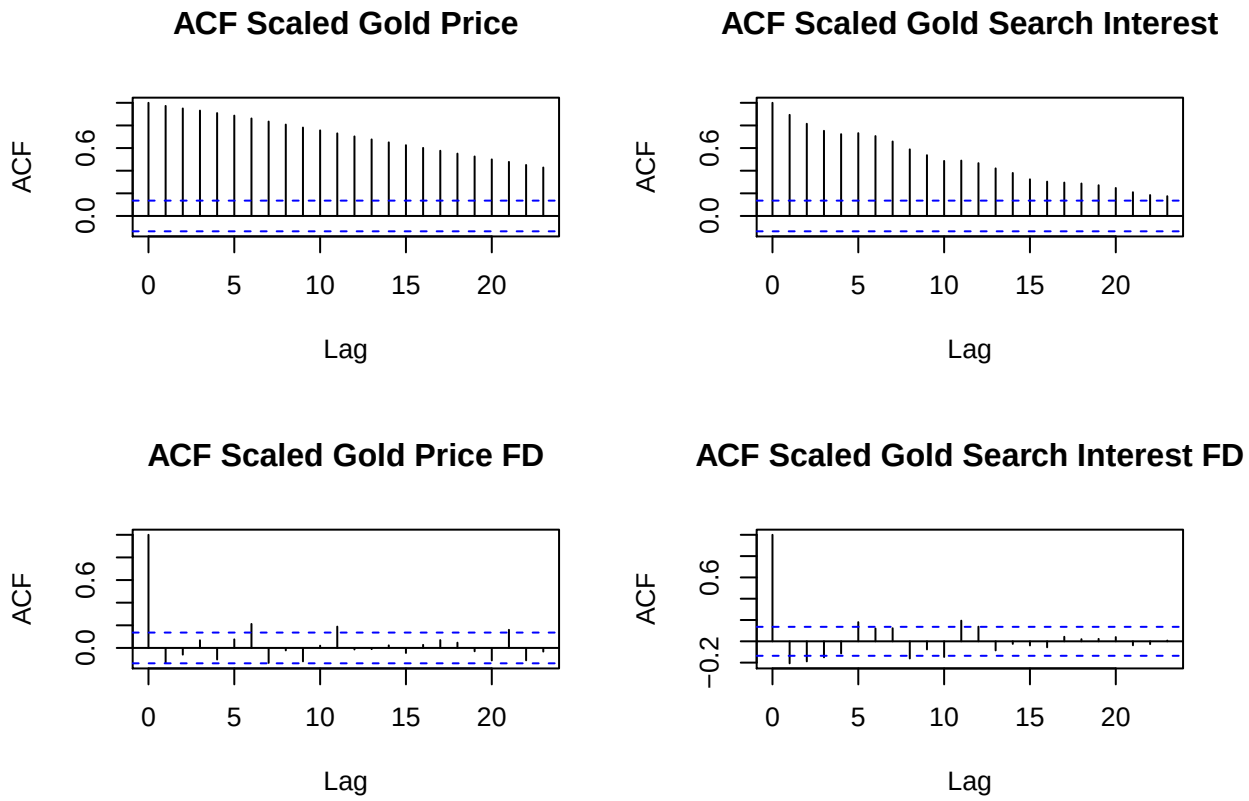
# create first difference on scaled variables:
gold_search_scaled_FD <- rep(0,t-1)
gold_price_scaled_FD <- rep(0,t-1)

for(i in 2:t-1){
  gold_price_scaled_FD[i-1] <- gold_price_scaled[i]-gold_price_scaled[i-1]
}
for(i in 2:t-1){
  gold_search_scaled_FD[i-1] <- gold_search_scaled[i]-gold_search_scaled[i-1]
}

# plot first differenced:
plot(y=gold_price_scaled_FD, x=gold_pr$DATE[1-209], lwd = 1, type = 'l',
     ylab = 'FD Scaled Price and Search Interest',
     xlab = 'Time', col = 'red')
lines(y= gold_search_scaled_FD, x=gold_pr$DATE[1-209], lwd = 1, col = 'blue')
legend('topleft', legend = c('search','price'),
       col = c('blue','red'), bty = "n", pch = c(19,19))
```

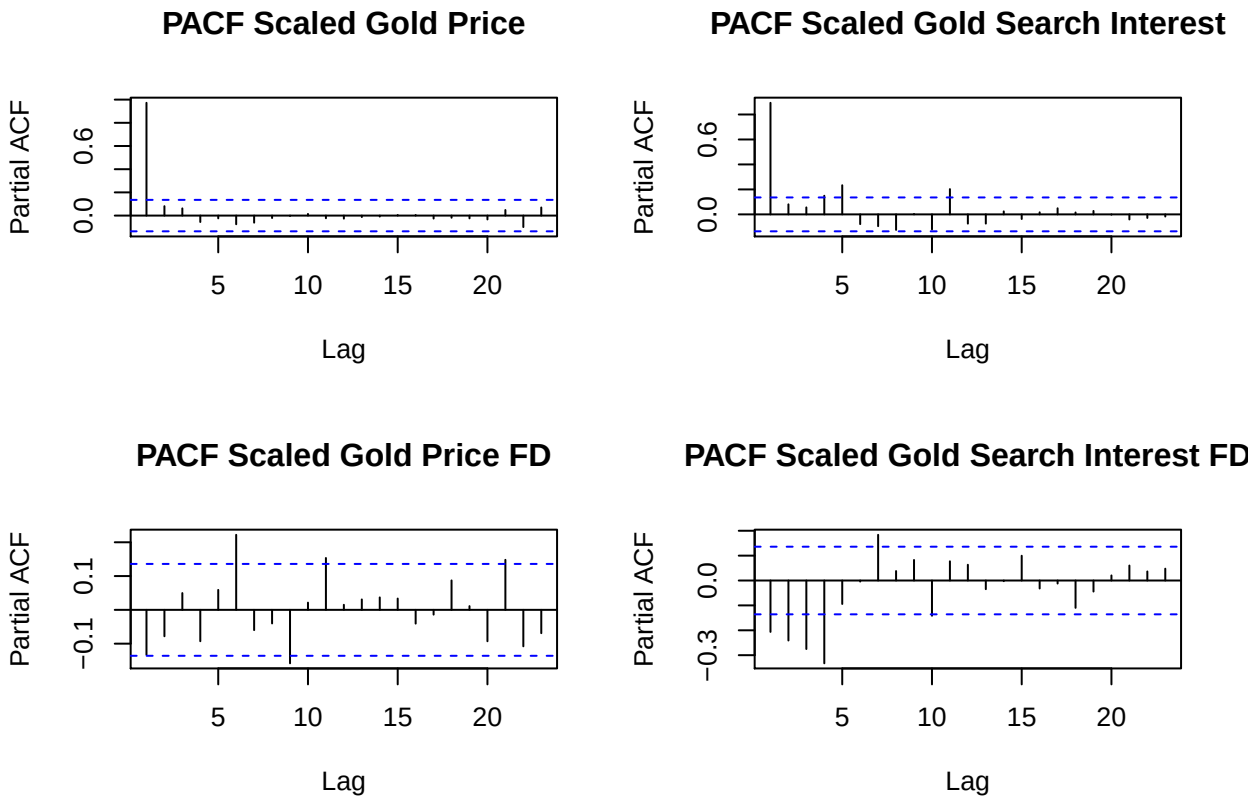


```r
# plot ACFs
par(mfrow=c(2,2))      # changes the plot layout to more easily compare them
acf(gold_price_scaled, main = 'ACF Scaled Gold Price')
acf(gold_search_scaled, main = 'ACF Scaled Gold Search Interest')
acf(gold_price_scaled_FD,main = 'ACF Scaled Gold Price FD')
acf(gold_search_scaled_FD, main = 'ACF Scaled Gold Search Interest FD')
```



```r
par(mfrow = c(1,1))    # revert layout changes

# plot PACFs
par(mfrow=c(2,2))      # changes the plot layout to more easily compare them
pacf(gold_price_scaled, main = 'PACF Scaled Gold Price')
pacf(gold_search_scaled, main = 'PACF Scaled Gold Search Interest')
pacf(gold_price_scaled_FD,main = 'PACF Scaled Gold Price FD')
pacf(gold_search_scaled_FD, main = 'PACF Scaled Gold Search Interest FD')
```



```
par(mfrow = c(1,1))    # revert layout changes
```

Unsurprisingly the rescaling does not matter for the autocorrelation as it is a scaled measure of linear relationships anyway.

ACF Scaled Gold Search Interest FD together with PACF Scaled Gold Search Interest FD gives evidence for an AR(4).

For the Gold Price it's ambiguous. Could be an MA, AR or an ARMA.

```
# Scaled non-differenced

# save variable vectors in time series format:
gold_price_scaled <- ts(gold_price_scaled, frequency = 12,

For the gold price we cannot reject the null of a non-stationary process (the random walk with drift+trend is the null), seems to fit conventional wisdom on prices. Prices are often thought about as following a random walk and thus being non-stationary. For the gold search index, we reject the H0, indicating a stationary porcess, given the data.

For gold price, we look at difference-stationarity.

```r
# Scaled First-differences

# save variable vectors as time series format:
gold_price_scaled_FD <- ts(gold_price_scaled_FD, frequency = 12,
                           start = c(2004, 2), end = c(2021, 5))      #excluding first observation.
gold_search_scaled_FD <- ts(gold_search_scaled, frequency = 12,
                            start = c(2004,2), end = c(2021,5))

As the DF-test for the first-difference gold price rejects, we cannot say that the data is not stationary. Which gives evidence for the gold price being an I(1) process.

The model is automated to difference such that the data is stationary, then the function finds the best forecasting model via the AIC. Here this would be an ARMA(0,1) model:

$$\widehat{\Delta \text{gold price}}_t = \underset{3.6766}{(7.1279)} + \epsilon_t + \underset{(0.0740)}{(-0.1411)}\epsilon_{t-1}$$

```r
# estimate model coefficients for VAR using AIC

VAR_lag <- VAR(y = VAR_data, type = 'both', ic = 'AIC', lag.max = 15)
summary(VAR_lag)

```

```
# dowsn't change much. Still the root problem (inside unit circle)
# I think the main problem is, that we regress an I(1) on a stationary variable.
```

4 Phillips-Ouliaris Cointegration Test

```
po.test(VAR_data, demean = TRUE, lshort = TRUE)
```

```
##
##  Phillips-Ouliaris Cointegration Test
##
## data:  VAR_data
## Phillips-Ouliaris demeaned = -19.431, Truncation lag parameter = 2,
## p-value = 0.06318
```

```
# for FD
po.test(VAR_data_FD, demean = TRUE, lshort = TRUE)
```

```
## Warning in po.test(VAR_data_FD, demean = TRUE, lshort = TRUE): p-value smaller
## than printed p-value
```

```
##
##  Phillips-Ouliaris Cointegration Test
##
## data:  VAR_data_FD
## Phillips-Ouliaris demeaned = -224.2, Truncation lag parameter = 2,
## p-value = 0.01
```

We cannot reject the null of the residuals being I(1). Thus we cannot rule out the case of a spurious or unbalanced regression. Note: as we only have one I(1) process and one non I(1) process this test makes no

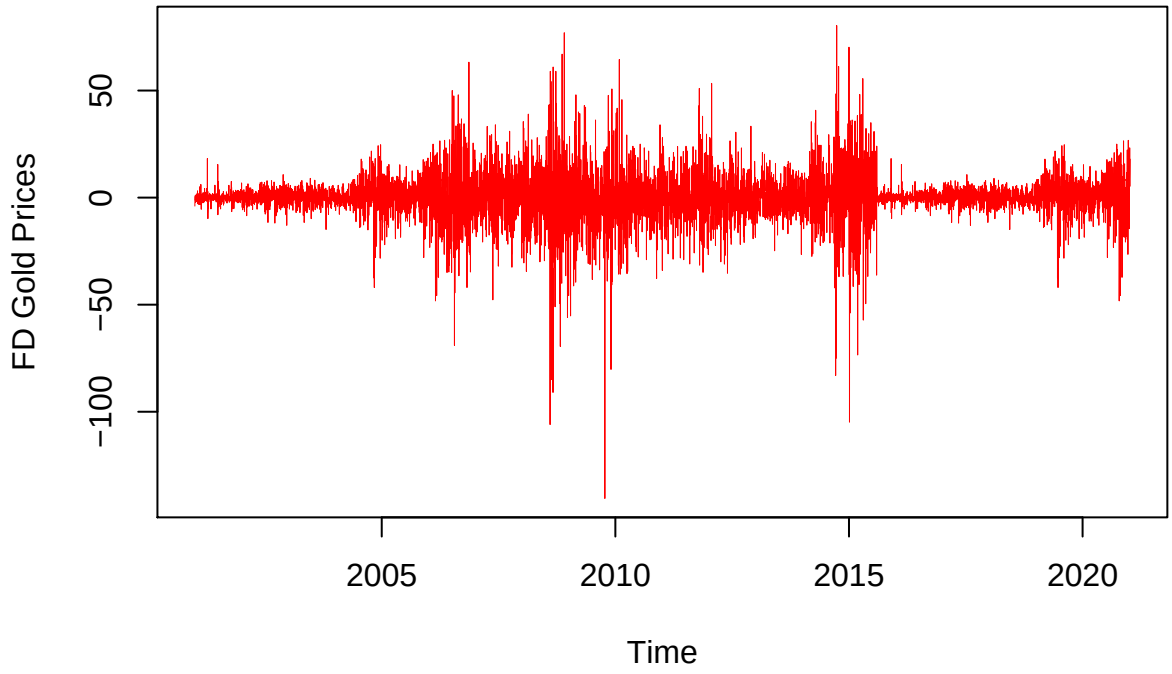
real sense.

5 Ideas for the first part: Univariate Time Series

6 Differenced MA(1) and ARCH Model for Gold Prices

```
# Differenced MA(1) and ARCH Model for Gold Prices
gold_price_FD <- ts(gold_daily_FD, frequency = 365,
                    start = c(2001, 1, 1), end = c(2021, 6, 10))   # with higher frequency

plot(gold_price_FD, ylab = 'FD Gold Prices', col = 'red', lwd = 0.5)
```



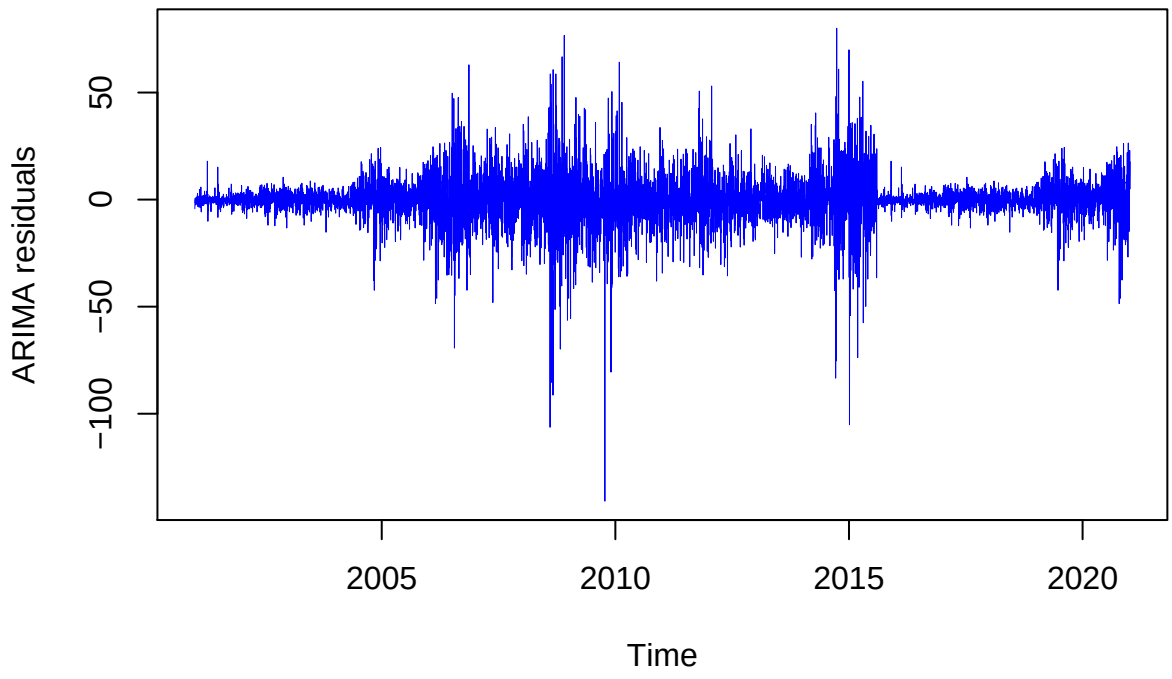
```
arima_model_HF_FD <- forecast::auto.arima(gold_price_FD, ic = 'aic')
arima_model_HF_FD
```

```
## Series: gold_price_FD
## ARIMA(0,0,0) with non-zero mean
##
## Coefficients:
##         mean
##       0.3201
## s.e.  0.1279
##
## sigma^2 estimated as 119.6:  log likelihood=-27841.45
## AIC=55686.9   AICc=55686.9   BIC=55700.69
```

```
# Auto-ARIMA suggests an ARMA(4,2) for daily prices

plot(forecast::arima.errors(arima_model_HF_FD),type = 'l', lwd = 0.5, col = 'blue',
     ylab = 'ARIMA residuals')
```

```
## Deprecated, use residuals.Arima(object, type='regression') instead
```



Going by the plot, it does not appear that the variance of the residuals is constant over time but rather has times of higher and lower volatility.
